**TRANSITIONAL APPROACHES TO CHANNELIZED INTERSECTIONS**

The values contained in the tables of this pamphlet provide the data necessary for either the design or the construction layout of the 128 types of transitional approaches to channelized intersections used by the Illinois Division of Highways.

PRINTED BY AUTHORITY OF THE STATE OF ILLINOIS

JANUARY, 1962

## INTRODUCTION

The tables in this pamphlet have been prepared in order to speed the work of both the design engineer and the construction engineer in laying out the transitional approaches to channelized intersections. They cover all of the types of approaches included in the normal designs of The Division of Highways of the State of Illinois, and contain all of the dimensions required for the layout of the approaches, either in plan preparation or field staking. The layouts shown in Fig. 1, page 131, Fig. 2, page 136, and Fig. 3 page 139 and the governing dimensions shown in the tables on pages 132, 133, 134, 135, 137, 138 and 140 for the 128 types of approaches covered in this pamphlet were developed by the Bureau of Design of the Illinois Division of Highways in compliance with the Policy of Geometric Design of Rural Highways published by AASHO.

The tables consisting of the transverse offsets from the highway centerline for all edges of pavement or pavements, and for both edges of the median and island at 25-foot intervals measured along the centerline of highway and indicated in the tables as stations, and for all points of curvature or reverse curvature which define the edges of pavement or pavements, island, median, were determined by electronic computation. Although the longitudinal measurements are shown in the tables under the heading of stations, they are actually lineal measurements in feet from the beginning of the transition to each of the points listed. The offsets shown in the tables were computed for approaches on tangent centerline alignment, using the lengths and radii of curves for the edges of pavement, median and island that conform to the standard design policy for each type of approach listed, and are shown in the tables with accompanying layouts on pages 131 through 140 of this pamphlet.

Although the tables were developed for tangent centerline alignment, they are equally suitable for the layout of approaches having curved centerline alignment, provided that in no case shall the degree of curvature of the centerline exceed  $1^{\circ}$ -30' for 70 MPH,  $2^{\circ}$ -30' for 60 MPH,  $4^{\circ}$ -00' for 50 MPH, and  $8^{\circ}$ -00' for 40 MPH design speeds. It is noted that in cases of curved centerline alignment of radii shown for the various types of transitions on tangent centerline do not apply. In fact in such cases the edges of pavement, median and island are not true circular curves, but some form of spiral. Regardless of this fact, the transitions resulting from holding the same offsets for curved centerline as for tangent centerline will provide vehicular paths which conform within tolerable limits to the design standards.

FIGURE 1

Figure 1 above provides the reference to nomenclature used in the tables of this pamphlet for design speeds of 70, 60, 50, and 40 MPH. The lengths of the curves, measured along the centerline of highway and indicated as stations, and the radius of curvature for the edges of pavements, median, and island shown in the following tables, pages 132, 133, 134 and 135, conform to the design standards of the state of Illinois and were used for the computation of the preceding tables of offsets from centerline at 25-foot longitudinal intervals.

## Longitudinal Dimensions That Apply to the Types of Approaches Illustrated in Figure 1

### 70 MPH

FIGURE 2

Figure 2 above provides the reference to nomenclature used in the tables of this pamphlet for design speeds of 70, 60, 50, and 40 MPH. The lengths of the curves, measured along the centerline of highway and indicated as stations, and the radius of curvature for the edges of pavements, median, and island shown in the tables on pages 137 and 138, conform to the design standards of the state of Illinois and were used for the computation of the preceding tables of offsets from centerline at 25-foot longitudinal intervals.

1/ Where station M<sub>2</sub> = M<sub>3</sub> there is no reverse curve on the right median edge.

FIGURE 3

Figure 3 above provides the reference to nomenclature used in the tables of this pamphlet for design speeds of 70, 60, 50, and 40 MPH. The lengths of the curves, measured along the centerline of highway and indicated as stations, and the radius of curvature for the edges of pavements, median, and island shown in the following tables, page 140, conform to the design standards of the state of Illinois and were used for the computation of the preceding tables of offsets from centerline at 25-foot longitudinal intervals.
